

HORDE OF HORRORS

Comprehensive Investment Prospectus & Business Plan

PROPOSED BY: Antigravity Studios

DATE: June 2026

CONTACT: investment@antigravitiystudios.com

VALUATION CAP: \$2.5 Million

CONFIDENTIALITY: Strict NDAs Apply

PROPOSAL HIGHLIGHTS: Seeking a \$250,000 Seed Round to fund development expansion, obtain premium 2D character/monster sprite assets, license orchestrations, and run user acquisition campaigns. High-fidelity mechanics (destructible cover, time-survival loops) differentiate the title in the \$18 Billion mobile roguelike market.

2. Executive Summary & Value Proposition

The mobile action roguelite genre has exploded in recent years, led by pathfinder titles such as *Vampire Survivors* and *Survivor.io*. However, the market faces a growing issue: **formulaic saturation**. Most current survival games rely on open-field kiting with zero mechanical interaction. This creates highly repetitive runs that suffer from steep drop-offs in long-term player engagement.

Horde of Horrors introduces a unique solution that transforms standard survivor kiting into a highly tactical combat experience: a dynamic, destructible cover system paired with interactive environmental obstacles and structured pre-wave briefings. This creates a tight mechanical feedback loop: instead of simply running away, players must actively navigate from node to node, using mossy tombstones, ruined stone pillars, and wooden barricades as shields against incoming ranged projectiles.

Dynamic Cover Mechanics	Visual Stack Tech
Cover blocks paths and enemy bullets. Cover has health and breaks dynamically, forcing players to adapt and relocate.	Gothic layered character model rendering. Generates pseudo-3D parallax visual effects at 60 FPS mobile performance.

Market Opportunity:

By merging the simple, addictive, single-handed controls of a casual roguelite with the atmospheric, premium horror art style associated with high-end RPG franchises (like *Diablo* and *Castlevania*), Horde of Horrors fits a high-value niche. This positioning targets the mid-core audience that has higher average revenue per paying user (ARPPU) than casual arcade players.

3. Core Gameplay Mechanics

A. Pre-Wave Stage Briefing Panel

Before each wave begins, the game pauses to show a premium pre-wave briefing panel. This screen acts as a strategic planning phase, displaying the current environment milestone, Expected Monsters, contextual survival tips, and a threat rating (■ to ■■■■■■). It features smooth zoom-in and fade animations (0.25s tweens) to establish atmosphere and build player anticipation.

B. Destructible Cover Obstacles

Cover obstacles (gravestones, pillars, barrels, barricades) spawn dynamically in the level, blocking both player and enemy movement and bullets. Each has structural health points (default: 150). When hit, they flash red and white. As health decreases, their sprite modulates toward red (simulating cracking and deterioration). Upon depletion, they crumble into debris particles, playing a heavy disintegration sound, exposing the player to damage.

C. Survival Countdown Loop & Cleansing Light

Unlike endless combat loops, normal stages operate on a survival timer (scaling from 30 to 90 seconds). Enemies spawn infinitely, with spawning rates multiplying by 2.5x during the final 10 seconds. When the clock hits 0:00, a blinding white screen-flash triggers a 'Holy Light' cleanse, instakilling all normal enemies and opening the Upgrade Shop. Boss fights occur on multiples of 10 waves and require defeating the boss inside a forcefield arena.

D. Roster & Ability Systems

Playable characters feature distinct movement stats and unique active abilities. For example, playing as Victor Van Helsing unlocks the '**Holy Stopping Power**' active ability. When clicked, it triggers a large radial knockback shockwave to clear the immediate area, adds +20 flat projectile damage for 4.0 seconds, and tints the character golden. Abilities run on custom cooldown structures.

4. Technical Architecture & Mobile Optimizations

Horde of Horrors is built using **Godot 4.3**, leveraging a highly optimized GDScript architecture designed specifically to maintain a constant **60 FPS** on mid-range and budget mobile devices. Our engineering pipeline focuses on heavy memory management and minimizing draw calls:

- **Custom Object Pooling (PoolManager.gd):** Renders and recycles hundreds of projectiles, impact particles, and blood splatters without garbage collection stutter, keeping memory usage constant and minimizing mobile CPU cycles.
- **Programmatic Collision Resolution:** Instantiated obstacles and players register collision channels programmatically (using dynamic binary mask bit shifts: `collision_mask |= 8`). This avoids scene-parsing overhead and ensures instant, robust physics resolution.
- **Decoupled Architecture:** Core game systems (UI, Wave Manager, Sound, Character selection) communicate via decoupled, signal-driven singletons (Autoloads), ensuring clean memory teardowns and making codebase extensions simple.

Engine / Module	Implementation Details	Performance Target
Rendering Engine	Godot 4.3 (Mobile OpenGL ES 3.0 backend)	Consistent 60 FPS
Memory Management	Object pooling for bullets, effects, and damage labels	< 150MB RAM footprint
Pathfinding AI	NavigationAgent2D with dynamic obstacle avoidance	< 1.5ms thread budget
Asset Pipeline	Black-background transparentized sprite strips	Minimal VRAM usage

5. Competitor Landscape & Competitive Edge

Horde of Horrors sits at the intersection of casual survivor mechanics and mid-core dark gothic RPG themes. Below is a direct comparison of Horde of Horrors against the current leading competitors in the mobile action space:

Feature Metric	Horde of Horrors	Survivor.io	Vampire Survivors	Zombie.io
Tactical Cover	Yes (Dynamic & Destructible)	No	No	No (Static obstacles only)
Art Direction	Dark Gothic Horror	Casual Cartoon	Retro 8-Bit Pixel	Casual Cartoon / Sci-Fi
Wave Objective	Survival timer + Boss milestones	Survival timer	Survival timer (30 mins)	Slay-all / Wave clearance
Active Skills	Yes (Cooldown active buttons)	No (Passive stats only)	No (Passive stats only)	No (Auto-activated only)
Rendering Speed	Lightweight Godot (60 FPS)	Unity (Heavier RAM)	Phaser / Custom C++	Unity (Very Heavy)

Strategic SWOT Analysis:

STRENGTHS (S)	WEAKNESSES (W)
• Unique destructible cover system adds active movement strategy. • Godot engine allows 60 FPS on low-end mobile devices.	• Limited marketing budget relative to multi-million publishers. • Highly reliant on acquiring premium character art assets.
OPPORTUNITIES (O)	THREATS (T)
• Rapidly growing \$18B action roguelite market size. • High visual shareability (TikTok loops) reduces UA costs.	• Clone titles copying core mechanics within weeks. • Shifts in platform ad targeting privacy regulations.

Competitive Edge: By focusing on tactical cover navigation and active hero abilities, Horde of Horrors solves the 'hands-off' passive gameplay issue of competitors, leading to higher D7/D30 retention.

6. User Acquisition & Cohort Retention Economics

Our commercialization plan utilizes organic visual loops to drive down paid marketing costs. Because our 'Stack Sprite' technology produces a striking, high-detail pseudo-3D look, short gameplay clips naturally capture high engagement on visual social networks (TikTok, Shorts, and Reels). This organic flywheel is paired with paid performance marketing optimized for a low Cost Per Install (CPI).

Target Retention and Unit Economics:

As modeled in the cohort chart above, our base target is to stabilize Cost Per Install (CPI) around **\$1.45 - \$1.55** during soft launch, and aggressively scale Customer Lifetime Value (LTV) to **\$4.50 by Month 12** through updates, cosmetics, and seasonal content. Our retention targets are: **Day 1: 42%**, **Day 7: 18%**, and **Day 30: 6%**.

Metric	Target Baseline	Gameplay / Revenue Driver
Cost Per Install (CPI)	\$1.50	Targeted mobile performance marketing campaigns
Average Daily Rev per User (ARPU)	\$0.15	Ad impressions + direct IAP shop conversions
Average Rev per Paying User (ARPPU)	\$8.50	Premium character purchases and high-tier gem bundles
Rewarded Video eCPM	\$18.50	Doubling wave gold, extra re-rolls, in-run revives
Interstitial Video eCPM	\$9.20	Sparsely displayed between unsuccessful runs (capped)

7. 3-Year Financial Projections

Our financial model assumes a soft launch in Q1 Year 1, followed by global roll-out in Q3 Year 1. Operating costs are kept low by utilizing Godot's lightweight open-source licensing structure (no engine royalties), allowing us to direct a higher percentage of seed funds toward marketing and asset production:

Metric Projections (USD)	Year 1 (Soft)	Year 2 (Global)	Year 3 (Live-Ops)
Active Player Cohort (MAUs)	250,000	1,800,000	4,200,000
Gross Revenue Projections	\$350,000	\$1,450,000	\$3,800,000
Marketing & UA Spend	\$125,000	\$450,000	\$1,000,000
Development & Server Cost	\$3,000	\$15,000	\$36,000
Projected Net Profit	\$222,000	\$985,000	\$2,764,000

Assumptions & Capital Efficiency:

Projections assume an organic growth coefficient (K-factor) of **K = 0.25** from visual shares, a payback period on paid acquisition of **T_p = 4.2 months**, and a Return on Ad Spend (ROAS) target of **165%** on Year 2 scale. Because operational expenses are extremely low, the project achieves profitability in Year 1.

8. Monetization & In-Game Economy

Horde of Horrors implements a balanced, high-conversion hybrid economy centered on two main progression paths:

- A. Double Currency Loop:** Players gather ****Gold**** (spent in-game between waves for immediate, random card upgrades in the Upgrade Shop) and ****Blood Essence**** (a persistent meta-currency dropped by boss monsters, used between runs to unlock permanent skill trees and unlock new characters).
- B. Rewarded Video Ad Placements:** Integrated to align player incentives. Watching a short video allows the player to double their wave gold, obtain a second shop re-roll, or revive once per run. This creates high daily active user (DAU) conversion without degrading premium gameplay value.
- C. Premium Purchases & Hero Unlocks:** Premium characters (like specific specialized classes of Victor Van Helsing or Elias Voss) are unlocked using paid gems or direct purchases. Vanity microtransactions (cosmetic character card animations, golden shockwave weapon effects) appeal to highly engaged players.
- D. Battle Passes (Gothic Seasons):** Generates recurring monthly revenue. Free and Premium tiers reward players with unique character profile skulls, lore journals, and exclusive skins as they complete weekly survival challenges.

Economy Design Table:

Item Category	Purchase Method	Gameplay Impact	Sinks / Usage
Character Cards	IAP / Meta-Essence	New active skills & base stats	Unlock playable roster
Gold Currency	Gameplay drop / Ads	Temporary wave buffs	Upgrade Shop purchases
Blood Essence	Boss drop / Gem pack	Permanent stat progression	Talent tree upgrades
Cosmetic Skins	Battle Pass / Gems	Purely visual flair	Character customization

9. Operational Roadmap & Milestones

Our development pipeline operates in two-week sprints. The core engine is established, and we are moving rapidly through subsequent developmental stages leading to public launch. The detailed roadmap below outlines our timeline:

- **Phase 1: Foundation (Weeks 1-2):** Rebuild mobile virtual joystick touch inputs, aim scanners, enemy scene hierarchies, and player character controller logic. *(Status: 100% Completed)*
- **Phase 2: Core Loop & Cover (Weeks 3-4):** Implement destructible cover obstacles, dynamically scale sprite bounds, update timer survival countdowns, and build the pre-wave briefing panel. *(Status: 100% Completed)*
- **Phase 3: Ranged Combat & Pooling (Weeks 5-6):** Implement Silver Crossbow resource parameters, projectile pooling structures, and navigation pathfinding agent routines.
- **Phase 4: Progression Mechanics (Weeks 7-8):** Integrate Sinister Card Upgrade menu systems, drop pickups (blood essence, speed buffers, shield nodes), and character selection panels.
- **Phase 5: Hero Expansion & Content (Weeks 9-10):** Build maps for Cathedral and Ruined Castle, implement werewolf charge/dash AI, and add Elias and Serena character assets.
- **Phase 6: Audio & Export (Weeks 11-12):** Add camera screenshake, blood particles, JSON save states, gothic background score, and export Android APK/iOS IPA packages for soft launch.

Milestone Roadmap Summary:

Milestone Category	Key Features Built	Current Status
Core Mechanics & Controls	Joystick, Auto-aim, State machines, Vector clamps	COMPLETED
Cover & Timer Survival	Destructible obstacles, Timer loops, Briefing panels	COMPLETED
Weapons & Pathfinding	Crossbow weapon, Projectile pooling, NavAgent2D pathing	PENDING
Meta-progression	Upgrade cards, drop essence pickups, selection menu	PENDING
Saves & Audio	JSON serializations, screenshake, particles, music, export	PENDING

10. Investment Offering & Use of Funds

Antigravity Studios is offering a **\$250,000 Seed Round** at a **\$2.5 Million Valuation Cap** via a Simple Agreement for Future Equity (SAFE) with a 20% discount. This round will fully fund the development team through the Phase 6 release milestone, purchase high-quality character assets, and establish initial user acquisition traction:

Category Allocation	Percentage	Funding Amount	Strategic Objective Deliverable
Game Client & Server Engineering	10%	\$25,000	Godot 4.3 optimization, server database saving.
Custom 2D Asset Procurement	30%	\$75,000	Hand-drawn stacked character/monster sprite strips.
Soft-Launch User Acquisition	50%	\$125,000	Targeted CPI testing and acquisition funnel tuning.
Operational Overheads & Legal	10%	\$25,000	Corporate filings, entity maintenance, NDA contracts.

11. Risks, Mitigations & Escrow Safeguards

Every early-stage investment involves market, technical, and commercial risks. Antigravity Studios maintains a structured risk mitigation model combined with financial oversight and milestone-based escrow payouts to safeguard investor capital:

Identified Risk Category	Impact	Probability	Strategic Mitigation Approach
User Acquisition Cost Inflation CPI rises above target projection limits.	HIGH	MEDIUM	Optimize organic TikTok/Shorts loop flywheels. Adjust targeting variables and run local geo-tests.
Development Timeline Slippage Milestone delay due to feature creep.	MEDIUM	LOW	Strict scope freeze for MVP features. Two-week agile sprints monitored by automated analytics dashboards.
Platform Store Restrictions App store review rejection or policy changes.	HIGH	LOW	Pre-check all licensing and guidelines. Build alternative web-based distribution and payment bypasses.
Live-Ops Server Scalability High backend server costs with rapid DAU growth.	MEDIUM	MEDIUM	Utilize decentralized local-first saving. Migrate to auto-scaling Google Cloud Firebase database clusters.

Financial Escrow & Governance:

To ensure complete transparency, seed round funds will be deposited into an escrow account. Capital releases will be tied to verified technical milestones (e.g. 35% on Phase 3 completion, 35% on Phase 5 completion, and the remaining 30% on Phase 6 public launch). Investors receive monthly financial audit logs and operational burndown reports.

12. Appendix: Mathematical Progression & Valuation Models

To satisfy institutional due diligence, our gameplay progression, enemy scaling, and unit economics are governed by strict mathematical models. These formulas prevent economy inflation and ensure consistent user progression difficulty:

A. Player Experience Level Scaling Formula

The experience points (XP) required to advance to player Level L scales non-linearly to ensure early progression is fast and engaging, while late-game levels require deep mechanical commitment:

$$XP(L) = 100 * L^{1.50}$$

Where L is the target player level. Advancing from Level 1 to 2 requires 141 XP, while advancing from Level 19 to 20 requires 8,944 XP, maintaining a long-term progression curve.

B. Enemy Health & Damage Scaling Equation

To scale game difficulty dynamically across waves, normal enemy health (HP) and damage (DMG) increase exponentially according to the wave index:

$$\begin{aligned} HP(W) &= HP_0 * (1.12)^W \\ DMG(W) &= DMG_0 * (1.08)^W \end{aligned}$$

Where HP_0 and DMG_0 are base monster attributes, and W is the wave index. This compound scaling creates a natural difficulty curve that challenges the player's build upgrades.

C. Cohort Retention Decay Function

Player cohort retention over time is modeled using a standard power-law decay function, which fits actual historical action-roguelite data better than exponential decay models:

$$R(t) = R_1 * t^{-0.56}$$

Where R_1 is the Day 1 retention (42%), and t is the number of days since installation. This model forecasts a stable long-term user plateau (6% at Day 30), establishing the foundation for our LTV projections.

D. Customer Lifetime Value (LTV) Calculation

Customer Lifetime Value (LTV) is computed as the integral of average daily revenue per active user (ARPPU) multiplied by Conversion Rate) against the player retention curve over the player lifecycle:

$$LTV(T) = \int_0^T [ARPU * R(t)] dt$$

Where $ARPU$ is the average daily revenue per active user (\$0.15) and $R(t)$ is retention. With $T = 360$ days, this integral converges to a project target LTV of **\$4.50**, yielding a 290% ROI against a \$1.55 CPI.
